**Distance Domain Specifications** (formerly Option 501, now standard with firmware revision v1.16 or higher)

Distance Domain Analysis is a powerful field test tool to analyze cables for faults, including minor discontinuities that may occur due to a loose connection, corrosion, or other aging effects. By using Frequency Domain Reflectometry (FDR), the VNA Master exploits a user-specified band of full power operational frequencies (instead of DC pulses from TDR approaches) to more precisely identify cable discontinuities. The VNA Master converts S-parameters from frequency domain into distance domain on the horizontal display axis, using a mathematical computation called Inverse Fourier Transform. Connect a reflection at the opposite end of the cable, and the discontinuities appear versus distance to reveal any potential maintenance issues. When access to both ends of the cable is convenient, a similar distance domain analysis is available on transmission measurements.

Distance Domain will improve your productivity with displays of the cable in terms of discontinuities versus distance. This readout can then be compared against previous measurements (from stored data) to determine whether any degradations have occurred since installation (or the last maintenance activity). More importantly, you will know precisely where to go to fix the problem and so minimize or prevent downtime of the system.

Round-Trip (reflection)	
Fault Resolution (meters)	$(0.5 \times c \times Vp) / \Delta F$ ; (c is speed of light = 299,792,458 m/s, $\Delta F$ is F2 - F1 in Hz)
One-Way (transmission)	
Fault Resolution (meters)	$(c \times Vp) / \Delta F$ ; (c is speed of light = 299,792,458 m/s, $\Delta F$ is F2 - F1 in Hz)
Horizontal Range (meters)	0 to (data points - 1) x Fault Resolution to a maximum of 3000 m (9843 ft)
Windowing	Rectangular, Nominal Side Lobe (NSL), Low Side Lobe (LSL), and Minimum Side Lobe (MSL)

**Time Domain (Option 2) Specifications** (includes Distance Domain)

The VNA Master can display the S-parameter measurements in the time or distance domain using lowpass or bandpass processing analysis modes. The broadband frequency coverage coupled with 4001 data points means you can measure discontinuities both near and far with unprecedented clarity for a handheld tool.

With this option, you can simultaneously view S-parameters in frequency, time, and distance domain to quickly identify faults in the field. Advanced features available with this option include step response, phasor impulse, gating, and frequency gated in time. The option includes computational routines that further enhance the Distance Domain results by compensating for cable loss, relative velocity of propagation, and dispersion compensation in waveguide. See the Distance Domain Specifications above.

**Option Comparison Table (Distance Domain and Time Domain)**

Measurement	Distance Domain (formerly Option 501)	Option 2 Time Domain
Distance-to-Fault	X	X
Distance Domain display	X	X
Windowing	X	X
Distance of Waveguide		X
Time Domain display		X
One Way vs. Round Trip Reflection		X
Phasor Impulse		X
Impulse Response		X
Step Response		X
Low Pass vs. Bandpass		X
Frequency Gated by Time		X
Frequency Gated by Distance		X

**Secure Data Operation (Option 7)**

For highly secure data handling requirements, this software option prevents the storing of measurement setup or data information onto any internal file storage location. Instead, setup and measurement information is stored ONLY to the external USB memory location. A simple factory preset prepares the VNA Master for transportation while the USB memory remains behind in the secure environment. The VNA Master cannot be switched between secure and non-secure operation by the user once configured for secure data operation. With this option enabled, the user can also choose to blank the frequency values displayed on the screen.

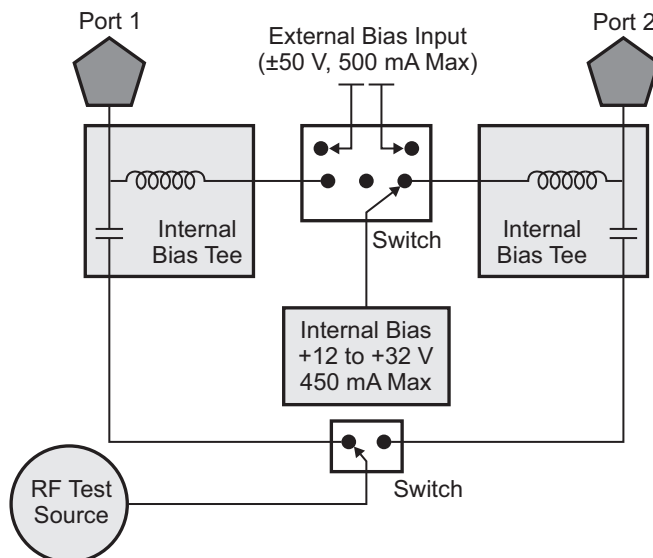

## Bias Tee (Option 10)

For tower mounted amplifier tests, the MS20x/3xC series with optional internal bias tees can supply both DC and RF signals on the center conductor of the cable during measurements. For frequency sweeps in excess of 2 MHz, the VNA Master can supply internal voltage control from +12 V to +32 V in 0.1 V steps up to 450 mA. To extend battery life, an external power supply can substitute for the internal supply by using the included external bias ports. Both test ports can be configured to supply voltage via this integrated bias tees option. Bias can be directed to VNA Port 1 or Port 2.

**Bias Tee Specifications** The VNA Master offers optional integrated bias tee for supplying DC plus RF0 to the DUT as shown in the simplified block diagram. Connectivity is also provided for external supply (instead of internal) to preserve battery consumption.

Frequency Range	2 MHz to 6 GHz (MS20x6C) 2 MHz to 15 GHz (MS20x7C) 2 MHz to 20 GHz (MS20x8C)
Internal Voltage/Current	+12 V to +32 V at 450 mA steady rate
Internal Resolution	0.1 V
External Voltage/Current	± 50 V at 500 mA steady rate
Bias Tee Selections	Internal, External, Off

## Balanced/Differential S-Parameters, 1-Port (Option 77)

As an alternative to a sampling oscilloscope, verifying the performance and identifying discontinuities in high-data-rate differential cables is now possible with the VNA Master. After a full two-port calibration, connect your differential cable directly to the two test ports and reveal the  $S_{d1d1}$  performance, which is essentially differential return loss, or any of the other differential S-Parameters,  $S_{c1c1}$ ,  $S_{d1c1}$ , or  $S_{c1d1}$ . With optional time domain, you can convert frequency sweeps to distance. This capability is especially valuable for applications in high data rate cables where balanced data formats are used to isolate noise and interference.

## Vector Voltmeter (Option 15)

A phased array system relies on phase matched cables for nominal performance. For this class of application, the VNA Master offers this special software mode to simplify phase matching cables at a single frequency. The similarity between the popular vector voltmeter and this software mode ensures minimal training is required to phase match cables. Operation is as simple as configuring the display for absolute or relative measurements. The easy-to-read large fonts show either reflection or transmission measurements using impedance, magnitude, or VSWR readouts. For instrument landing system (ILS) or VHF Omni-directional Range (VOR) applications, a table view improves operator efficiency when phase matching up to twelve cables. The MS202x/3xC solution is superior because the signal source is included internally, precluding the need for an external signal generator.
